300mA Low Dropout Linear Regulator with Shutdown

Description

The FP6133 is a low dropout, positive linear regulator with very low quiescent current. The FP6133 can supply 300mA output current with low dropout voltage at about 250mV. The BP pin with a 0.1uF bypass capacitor can help reduce the output noise level. The shutdown function can provide remote control for the external signal to decide the on/off state of FP6133. With a logic high level at $\overline{SHDN}$ pin, the device is in the on state, and vice versa.

The FP6133 regulator is able to operate with output capacitors as small as 1μF for stability. The FP6133 also offers the on chip thermal shutdown feature providing protection against overload or any condition when the ambient temperature exceeds the maximum junction temperature.

The FP6133 offers high precision output voltage of ± 2%. It is available in fixed output voltages including 1.5V, 1.8V, 2.5V, 2.8V, 2.9V, 3.0V, 3.1V, 3.2V, 3.3V and 3.6V.

The FP6133 is housed in low-profile, space-saving SOT-23-5, SC-70-5 and SC-82 packages.

Features

- Low Dropout Voltage of 250mV at 300mA
- High Ripple Rejection at 60 dB
- Guaranteed 60mA Output Current
- Very Low Quiescent Current at 30μA
- Max. ± 2% Output Voltage Accuracy
- Needs Only 1μF Capacitor for Stability
- Thermal Shutdown Protection
- Current Limit Protection
- Active Low Shutdown Control
- Low-ESR Ceramic Capacitor for Output Stability
- Tiny Packages: SOT-23-5, SC-70-5 and SC-82
- RoHS Compliant

Applications

- DSC
- Wireless Devices
- LCD Modules
- Battery Power Systems
- Card Readers
- PDA

Typical Application Circuit

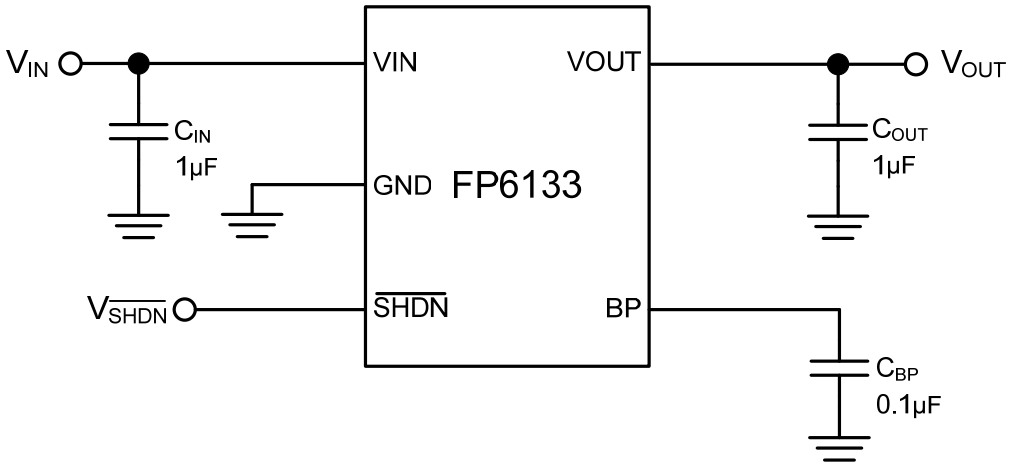

Figure 2. Typical Application Circuit of FP6133

Note2：To prevent oscillation, it is recommended to use minimum 1μF X7R or X5R dielectric capacitors if ceramics are used as input/output capacitors.

Functional Pin Description

Pin Name	Pin Function
VIN	Power is supplied to this device from this pin which is required an input filter capacitor. In general, the input capacitor in the range of 1μF to 10μF is sufficient.
VOUT	The output supplies power to loads. The output capacitor is required to prevent output voltage from oscillation. The FP6133 is stable with an output capacitor 1μF or greater. The larger output capacitor will be required for application with larger load transients. The large output capacitor could reduce output noise, improve stability, and PSRR.
GND	Common ground pin
BP	Reference Noise Bypass
$\overline{\text{SHDN}}$	Pull this pin high to enable IC , pull this pin low to shutdown IC

Ripple Rejection (Note6)	PSRR	V_{IN}=V_{OUT}+1V, C_{BP}=0.1μF f_{RIPPLE} = 120Hz, C_{OUT} = 1μF			60		dB
Temperature Coefficient (Note6)	T.C.	I_{OUT} = 1mA, V_{IN} = 5V			50		ppm/ ºC
Thermal Shutdown Temperature (Note6)	T_{SD}				160		ºC
	ΔT_{SD}	Hysteresis			25		ºC
Shutdown Pin Current	$I_{\overline{SHDN}}$					0.1	μA
Noise Bypass Terminal Voltage	V_{REF}				1.23		V
Shutdown Pin Voltage	$V_{\overline{SHDN}(ON)}$	Output ON		1.4			V
	$V_{\overline{SHDN}(OFF)}$	Output OFF				0.4	V
Shutdown Exit Delay Time (Note6)	ΔT	C_{BP}=0.1uF, C_{OUT}=1uF, I_{OUT}=30mA			300		μs

Note4：The dropout voltage is defined as V_{IN}-V_{OUT}, which is measured when V_{OUT} drops 2% of its normal value with the specified output current.

Note5：Load regulation and dropout voltage are measured at a constant junction temperature by using a 40ms low duty cycle current pulse.

Note6：Guarantee by design.

Application Information

The FP6133 is a low dropout linear regulator that could provide 300mA output current at dropout voltage about 250mV. Current limit and on chip thermal shutdown features provide protection against any combination of overload or ambient temperature that could exceed maximum junction temperature.

Output and Input Capacitor

The FP6133 regulator is designed to be stable with a wide range of output capacitors. The ESR of the output capacitor affects stability. Larger value of the output capacitor decreases the peak deviations and improves transient response for larger current changes.

The capacitor types (aluminum, ceramic, and tantalum) have different characterizations such as temperature and voltage coefficients. All ceramic capacitors are manufactured with a variety of dielectrics, each with different behavior across temperature and applications. Common dielectrics used are X5R, X7R and Y5V. It is recommended to use 1uF to 10uF X5R or X7R dielectric ceramic capacitors with 30mΩ to 50mΩ ESR range between device outputs and ground for stability. The FP6133 is designed to be stable with low ESR ceramic capacitors and higher values of capacitors and ESR could improve output stability. The ESR of output capacitor is very important because it generates a zero to provide phase lead for loop stability.

There are no requirements for the ESR on the input capacitor, but its voltage and temperature coefficient have to be considered for device application environment.

Protection Features

In order to prevent overloading or thermal condition from damaging the device, FP6133 has internal thermal and current limiting functions designed to protect the device. It will rapidly shut off PMOS pass element during over temperature condition.

Thermal Consideration

The power handling capability of the device will be limited by allowable operation junction temperature (125°C). The power dissipated by the device will be estimated by $P_D = I_{OUT} \times (V_{IN}-V_{OUT})$. The power dissipation should be lower than the maximum power dissipation listed in “Absolute Maximum Ratings” section.

Shutdown Operation

The FP6133 is shutdown by pulling the $\overline{SHDN}$ input low, and turned on by driving the $\overline{SHDN}$ high. If this function is not used, the $\overline{SHDN}$ input should be tied to VIN to keep the regulator on at all times (the $\overline{SHDN}$ must not be left floating).
