Description

Hewlett Packard's HBFP-0420 is a high performance isolated collector silicon bipolar junction transistor housed in a 4-lead SC-70 (SOT-343) surface mount plastic package.

HBFP-0420 provides an associated gain of 17 dB, noise figure of 1.1 dB, and $P_{1\text{dB}}$ of 12 dBm at 1.8 GHz. Because of high gain and low current characteristics, HBFP-0420 is ideal for *cellular/PCS handsets* as well as for *C-Band and Ku-Band* applications.

This product is based on a 25 GHz transition frequency fabrication process, which enables the products to be used for high performance, low noise applications at 900 MHz, 1.9 GHz, 2.4 GHz, and beyond.

S and noise parameters are measured on a microstrip line made on 0.025 inch thick alumina carrier. The input reference plane is at the end of the base lead, the output reference plane is at the end of the collector lead. S and noise parameters include the effect of four plated through via holes connecting emitter landing pads on the top of test carrier to the microstrip ground plane on the bottom side of the carrier. Two 0.020 inch diameter via holes are placed within 0.010 inch from each emitter lead contact point, one via on each side of that point.

HBFP-0420 Die Model and PSPICE Parameters

This model can be used as a design tool. It has been tested on MDS for various specifications. However, for more precise and accurate design, please refer to the measured data in this data sheet.

Note: The value of beta was high (BF = 1E6) to compensate for the fact that diode DBE reduces the current going into the base (current flows through DBE). The diodes are necessary to model the non-linear effects.
