

STM1061

Low Power Voltage Detector

FEATURES

- FACTORY-TRIMMED VOLTAGE THRESHOLDS IN 0.1V INCREMENTS FROM 1.6V TO 5.5V
- $\pm 2\%$ VOLTAGE THRESHOLD ACCURACY
- OPERATING VOLTAGE 0.7V to 6.0V
- OPEN DRAIN OUTPUT
- LOW SUPPLY CURRENT - 0.9 μ A (typ)
- GUARANTEED $\overline{\text{OUT}}$ ASSERTION DOWN TO $V_{\text{CC}} = 0.7\text{V}$
- POWER SUPPLY TRANSIENT IMMUNITY
- AVAILABLE IN SOT23-3 and SOT323-3 (SC70-3) PACKAGES
- OPERATING TEMPERATURE -40°C TO 85°C

SUMMARY DESCRIPTION

The STM1061 low power voltage detector provides monitoring of battery, power-supply, and regulated system voltages. A precision voltage reference and comparator monitors the V_{CC} input and compares it with a specified voltage threshold condition. When V_{CC} falls below a specified trip point threshold, the output ($\overline{OUT}$) is forced low and remains asserted as long as the V_{CC} input re-

mains below V_{TH-} + hysteresis (V_{HYST}). The STM1061 device is guaranteed to output the correct logic state for V_{CC} down to 0.7V. They are also designed to ignore fast transients on V_{CC} .

This small, low power device is ideal for portable applications and is available in space-saving SOT23-3 and SOT323-3 (SC70-3) packages.

PIN DESCRIPTIONS

See [Figure 2., page 4](#) and [Table 1., page 4](#) for a brief overview of the signals connected to this device.

$\overline{\text{OUT}}$ (Open Drain). This is the Open Drain Output. It goes low when V_{CC} drops below V_{TH-} , and remains low as long as V_{CC} is below $V_{TH-} + V_{HYST}$.

V_{CC} . This is the Supply voltage and input for the Voltage Detector.

V_{SS} . Ground, V_{SS} , is the reference for the power supply. It must be connected to the system ground.

Table 2. Pin Functions

Pin		Name	Function
SOT23-3	SOT323-3 (SC70-3)		
1	2	$\overline{\text{OUT}}$	Active-Low Open Drain Output
3	3	V_{CC}	Supply Voltage
2	1	V_{SS}	Ground

OPERATION

Output

The STM1061 Voltage Detector monitors system voltages from 1.6V to 5V in 100mV increments. The detector is designed to ignore fast transients on V_{CC} and has a voltage hysteresis (V_{HYST}). The STM1061 asserts an output signal ($\overline{\text{OUT}}$) whenever V_{CC} goes below the Voltage Detect Threshold (V_{TH-}). The output signal ($\overline{\text{OUT}}$) stays asserted until V_{CC} goes above the Voltage Detect Release (V_{TH+}). Output voltage (V_{OUT}) is guaranteed valid down to $V_{CC} = 0.7V$ at 25°C.

The STM1061 has an open drain active-low output which will sink current when $\overline{\text{output}}$ is asserted. Connect a pull-up resistor from $\overline{\text{OUT}}$ to any supply voltage up to 6V (see [Figure 6., page 5](#)). Select a resistor value large enough to register a logic low, and small enough to register a logic high while all of the input current and leakage paths connected to the reset output line are being supplied. A 10k pull-up is sufficient in most applications.

The advantages of open drain output is the ability to connect more open drain outputs in parallel (wired OR connections) as well as connect the output to a power supply voltage different from V_{CC} .

Negative-Going V_{CC} Transients and Undershoot

The STM1061 device is relatively immune to negative-going V_{CC} transients (glitches). The graph (see [Figure 11., page 9](#)) indicates the maximum pulse width a negative V_{CC} transient can have without causing a reset pulse. As the magnitude of the transient increases (further below the threshold), the maximum allowable pulse width decreases. Any combination of duration and overdrive which lies under the curve will NOT generate a reset signal.

A 0.1μF bypass capacitor mounted as close as possible to the V_{CC} pin provides additional transient immunity.

MAXIMUM RATING

Stressing the device above the rating listed in the Absolute Maximum Ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not im-

plied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Table 3. Absolute Maximum Ratings

Symbol	Parameter	Value	Unit
T _{STG}	Storage Temperature (V _{CC} Off, V _{BAT} Off)	–55 to 150	°C
T _{SLD} ⁽¹⁾	Lead Solder Temperature for 10 seconds	260	°C
V _{IO}	Input or Output Voltage	–0.3 to V _{CC} +0.3	V
V _{CC}	Supply Voltage	0.7 to 6.0	V
I _O	Output Current	20	mA
P _D	Power Dissipation	320	mW

Note: 1. Reflow at peak temperature of 255°C to 260°C for < 30 seconds (total thermal budget not to exceed 180°C for between 90 to 150 seconds).

DC AND AC PARAMETERS

This section summarizes the operating measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC characteristics Tables that follow, are derived from tests performed under the Measurement

Conditions summarized in Table 4, Operating and AC Measurement Conditions. Designers should check that the operating conditions in their circuit match the operating conditions when relying on the quoted parameters.

Table 4. Operating and AC Measurement Conditions

Parameter	STM1061	Unit
V _{CC} Supply Voltage	0.7 to 6.0	V
Input Rise and Fall Times	≤ 5	ns
Input Pulse Voltages	0.2 to 0.8V _{CC}	V
Input and Output Timing Ref. Voltages	0.3 to 0.7V _{CC}	V

Figure 15. AC Testing Input/Output Waveforms

Figure 16. Voltage Timing Waveform

Table 5. DC and AC Characteristics

Sym	Description	Test Condition ⁽¹⁾	Min	Typ	Max	Unit
V _{CC}	Operating Voltage		0.7		6.0	V

		V _{CC} = 2.0V	3.0	14		mA
		V _{CC} = 3.0V	5.0	22		mA
		V _{CC} = 4.0V	6.0	26		mA
		V _{CC} = 5.0V	7.0	30		mA
Voltage Thresholds						
V _{TH−}	Detect Voltage (see Table 9. , page 18 for detailed listing)		V _{TH−} − 2%	V _{TH−}	V _{TH−} + 2%	V
V _{TH+}	Release Voltage			V _{TH−} + V _{HYST}		V
V _{HYST}	Threshold Hysteresis		0.02V _{TH−}	0.05V _{TH−}	0.08V _{TH−}	V
t _{PD}	V _{CC} to $\overline{\text{OUT}}$ Detect Delay	V _{CC} falling from (V _{TH−} + 100mV) to (V _{TH−} − 100mV) at 10mV/μs		25		μs
t _{PR}	V _{CC} to $\overline{\text{OUT}}$ Release Delay	V _{CC} rising from (V _{TH+} − 100mV) to (V _{TH+} + 100mV) at 10mV/μs		30	200	μs
	Threshold Temperature Coefficient			±100		ppm/ °C

Note: 1. Valid for Ambient Operating Temperature: T_A = 25°C.

PACKAGE MECHANICAL

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97.

The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.

REVISION HISTORY

Table 10. Document Revision History

Date	Version	Description
20-January-2004	1.0	First Edition
01-Aug-05	1.1	Update Operation section, characteristics; insert new graphics; add ECOPACK information (Figure 7 , 8 , 9 , 10 , 11 , 12 , 13 , 14 ; Table 5 , 8 , 9)
02-Sep-05	1.2	Update characteristics, remove 'push-pull output' reference (Figure 8 , 9 , 10 , 11 , 12 , 16 ; Table 2 , 4 , 5 , 8)
19-Oct-05	2.0	Status upgrade; update characteristics; add Marking information (Figure 7 , 8 , 9 , 10 , 11 , 12 , 13 , 14 ; Table 8 , 9)
