

OUTLINE

The R3113D series are CMOS-based voltage detector ICs with high detector threshold accuracy and ultra-low supply current, which can be operated at an extremely low voltage and is used for system reset as an example.

Each of these ICs consists of a voltage reference unit, a comparator, resistors for detector threshold setting, an output driver and a hysteresis circuit. The detector threshold is fixed with high accuracy internally and does not require any adjustment.

Two output types, Nch open drain type and CMOS type are available.

Since the package is ultra-small SON1408-3 (MFPK), high density mounting on board is possible .

FEATURES

- Ultra-low Supply CurrentTyp. 1.4 μ A ($V_{DET}>1.5V$: $V_{DD}=V_{DET}+1.0V$)
- Wide Range of Operating Voltage0.6V to 6.0V ($V_{DET}=3.0V$, $T_{opt}=25^{\circ}C$)
- Detector ThresholdStepwise setting with a step of 0.1V in the range
from 1.2V to 4.5V is possible.
- High Accuracy Detector Threshold..... $\pm 2.0\%$
- Low Temperature-Drift Coefficient of Detector Threshold...Typ. $\pm 100ppm/^{\circ}C$
- Two Output TypesNch Open Drain and CMOS
- Ultra-small PackageSON1408-3

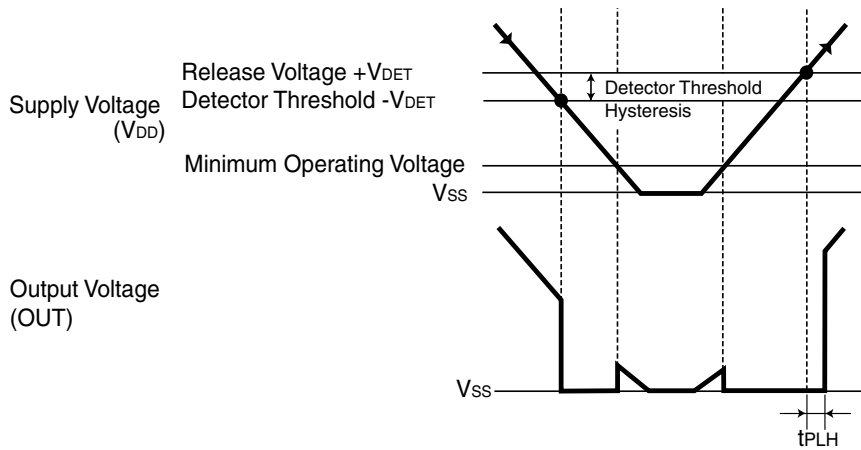

APPLICATIONS

- CPU and Logic Circuit Reset
- Battery Checker
- Window Comparator
- Wave Shaping Circuit
- Battery Back-up Circuit
- Power Failure Detector

BLOCK DIAGRAMS

TIMING CHART

DEFINITION OF OUTPUT DELAY TIME

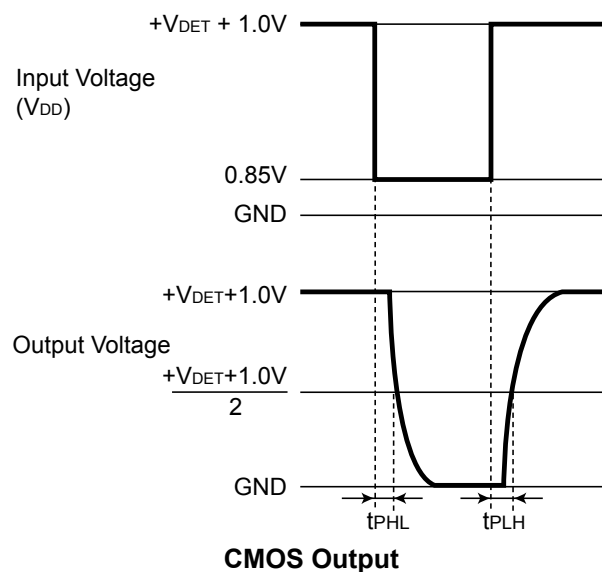

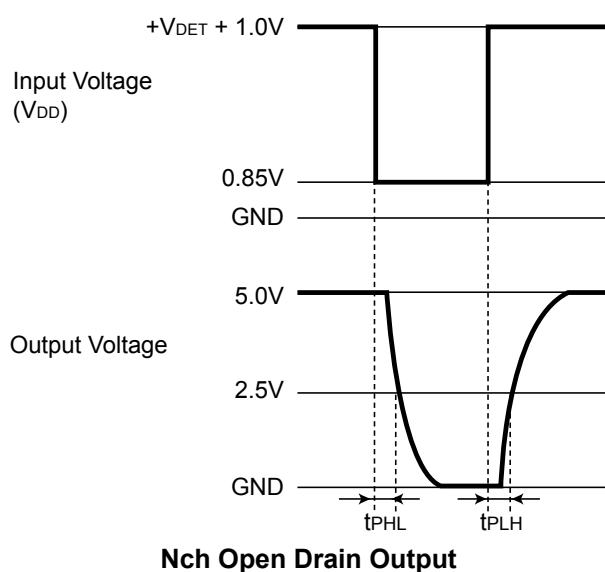

Output Delay Time t_{PLH} is defined as follows:

1. In the case of Nch Open Drain Output:

Under the condition of the output pin (OUT) is pulled up through a resistor of 470k Ω to 5V, the time interval between the rising edge of V_{DD} pulse from 0.85V to $(+V_{DET})+ 1.0V$ and becoming of the output voltage to 2.5V.

2. In the case of CMOS Output:

The time interval between the rising edge of V_{DD} pulse from 0.85V to $(+V_{DET})+ 1.0V$ and becoming of the output voltage to $(V_{DD}/2)$ V.

SELECTION GUIDE

The detector threshold, the output type and the taping type of R3113 Series can be designated at the users' request by specifying the part number as follows;

R3113xxx1x-xx ← Part Number
 ↑ ↑ ↑ ↑
 a b c d

Code	Contents
a	Designation of Package Type; SON1408-3
b	Setting Detector Threshold ($-V_{DET}$); Stepwise setting with a step of 0.1V in the range of 1.2V to 4.5V is possible.
c	Designation of Output Type; A: Nch Open Drain C: CMOS
d	Designation of Packing or Taping Type; Ex. TR prescribed as standard directions. (Refer to Taping Specifications.) Antistatic bag for samples: C

PIN CONFIGURATION

● SON1408-3

PIN DESCRIPTION

● R3113D

Pin No.	Symbol	Description
1	OUT	Output Pin
2	V _{DD}	Input Pin
3	GND	Ground Pin

ABSOLUTE MAXIMUM RATINGS

Symbol	Item	Rating	Unit
V _{DD}	Supply Voltage	6.5	V
V _{OUT1}	Output Voltage (CMOS)	V _{SS} -0.3 to V _{DD} +0.3	V
V _{OUT2}	Output Voltage (Nch)	V _{SS} -0.3 to 6.5	V
I _{OUT}	Output Current	20	mA
P _D	Power Dissipation ^{*Note1}	250	mW
T _{opt}	Operating Temperature Range	-40 to 85	°C
T _{stg}	Storage Temperature Range	-55 to 125	°C
T _{solder}	Lead temperature (Soldering)	260°C, 10s	

*Note 1: Applied to SON1408-3 at mounted on board

P_D depends on conditions of mounting on board.

This specification is based on the measurement at the condition below:

*Measurement Conditions

Environment: Mounted on board (Wind velocity 0m/s)

Board Material: FR-4 (2-layer)

Board dimensions: 40mm × 40mm × t1.6mm

Copper Area: 50%(Both Sides)

Tab pin (Pin 3) land pattern width is same as the lead, connected to the GND plane.

OPERATION

Figure 1. Block Diagram

Figure 2. Operation Diagram

Step 1. The output voltage is equal to the supply voltage (V_{DD}).

Step 2. At Point "A", $V_{ref} \geq V_{DD} \times (R_b + R_c) / (R_a + R_b + R_c)$ is true, as a result, the output of comparator is reverse, and output voltage becomes to GND level. The voltage level of Point A means detector threshold voltage, or ($-V_{DET}$).

Step 3. When the supply voltage is less than minimum operating voltage, the operation of output transistor becomes indefinite, and in the case that output is pulled up to V_{DD} , the output voltage equals to V_{DD} voltage.

Step 4. The output voltage equals to GND level.

Step 5. At Point "B", $V_{ref} \geq V_{DD} \times R_b / (R_a + R_b)$ is true, Output of the comparator is reverse, and output voltage is equal to the supply voltage, or (V_{DD}). The voltage level of Point B means released voltage, or ($+V_{DET}$).

* The difference between released voltage and detector threshold voltage is the detector threshold hysteresis.

TEST CIRCUITS

*Pull-up circuit is not necessary for CMOS Output type, or R3113DxxxC.

TECHNICAL NOTES

Figure 9

Figure 10

1. In Figure 9, When R3113Dxx1C is used, and if an impedance is connected between Voltage Supplier and the V_{DD} Pin of R3113Dxx1C Series, the operation might be unstable by cross conduction current at detection.
When R3113Dxx1A is used in Figure 9, if the value of R is set excessively large, voltage drop may occur caused by supply current of IC itself and Detector threshold may vary.
2. Wiring as shown in Figure 10 may cause the oscillation in both output types of R3113 Series.
