

# IC for System Reset Monolithic IC PST573

November 21, 2001

## Outline

This IC functions in a variety of CPU systems and other logic systems, to detect supply voltage and reset the system accurately when the power is turned on or interrupted. It is a high-reset type system reset IC with ultra-low current consumption developed using high-resistance process and current-minimizing circuit design technology.

## Features

1. Ultra-low current consumption	$I_{CCH}=450\mu A$ typ. $I_{CCL}=1\mu A$ typ.
2. Low operating limit voltage	0.65V typ.
3. Large output current during power-on	-6mA typ.
4. Hysteresis voltage provided for detection voltage	50mV typ.
5. 10 ranks of detection voltages are available.	PST573      C : 4.5V typ.    H : 3.1V typ. D : 4.2V typ.    I : 2.9V typ. E : 3.9V typ.    J : 2.7V typ. F : 3.6V typ.    K : 2.5V typ. G : 3.3V typ.    L : 2.3V typ.

## Packages

MMP-3A (PST573□M)

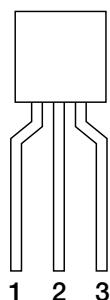

TO-92A (PST573□)

\*The box represents a rank of detection voltage.

## Applications

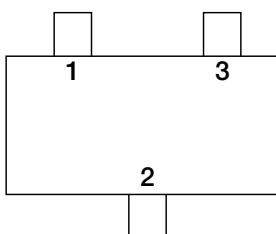

1. Reset circuits for microcomputers, CPUs and MPUs
2. Reset circuits for logic circuits
3. Battery voltage check circuits
4. Back-up power supply switching circuits
5. Level detection circuits

## Application circuits

### 1. Normal hard reset

Delay time (tpLH)

$$\approx C_L \times R_L \times \left[ \ln \frac{V_{CC} - 0.2}{V_{Scpu}} \right] + 0.025 \text{ (ms)}$$

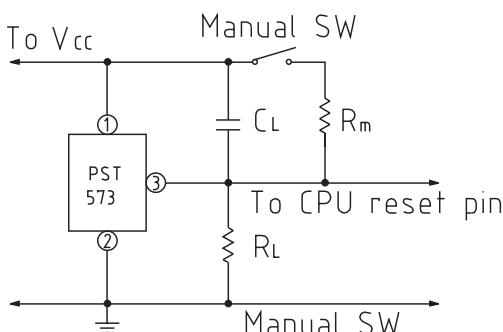

$C_L$ :  $\mu\text{F}$

$R_L$ :  $\text{k}\Omega$        $V_{Scpu}$ : Reset threshold voltage of CPU, MPU, etc.

Voltage: V

Note: Connect a capacitor between IC pins 1 and 2 if  $V_{CC}$  line impedance is high.

### 2. Manual reset added

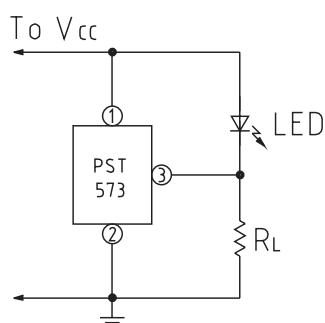

Note 1: Use  $R_L$ ,  $C_L$  and  $R_m$  to prevent manual switch chattering.

Note that  $R_m$  should be set to the following conditions.

$$R_m \leq 1/20 R_L$$

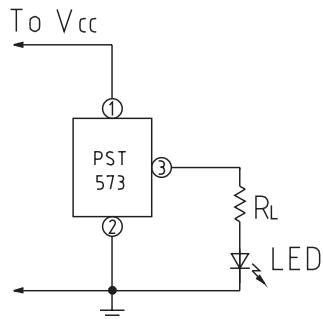

Note 2: Connect a capacitor between IC pins 1 and 2 if  $V_{CC}$  line impedance is high.

### 3. Battery checker (LED ON for high voltage)

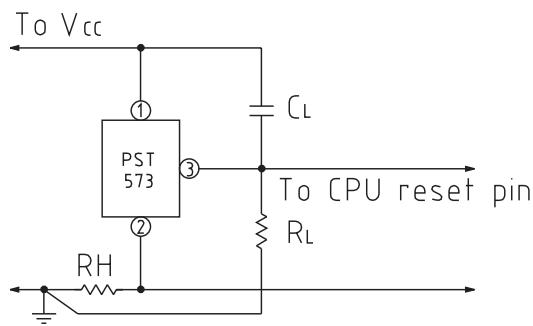

Note: Connect a capacitor between IC pins 1 and 2 if  $V_{CC}$  line impedance is high.

#### 4 Battery checker (LED ON for low voltage)

Note: Connect a capacitor between IC pins 1 and 2 if V<sub>cc</sub> line impedance is high.

#### 5. Hysteresis voltage UP method

When increasing hysteresis voltage for stable system operation, determine R<sub>H</sub> as follows and connect externally.

However, I<sub>CCH</sub> is -5000PPM/°C, so perform temperature compensation at R<sub>H</sub> when using over a wide temperature range.

Hysteresis voltage UP amount ( $\Delta V_{sup}$ ) is  

$$\Delta V_{sup} \doteq R_H \times I_{CCL}$$

Total hysteresis voltage ( $\Delta V_{total}$ ) is  

$$\Delta V_{total} \doteq V_s + \Delta V_{sup}$$

Note: Connect a capacitor between IC pins 1 and 2 if V<sub>cc</sub> line impedance is high.
